Carl de Witt   U21444928   Class Test 2

1) I would assume that if there were an error in the makeajaxcall() and the user does not know about this then there might never be something in details and it will return empty string or even null. A way you can fix it is to make it a .then() after the call and that will execute if there is an error or not.

2) This is important because you don't want to send your files with all then node modules, so when another person want to install all of the node modules the the module that you are looking for might depend on another module so then npm will automatically install it for you.
